and Information Science*

# Improving Software ROI through Requirements Validation

## A Web Based Wireless Order Management System

October 31, 2002

**David Cohen, Ph.D.,**  
President

**sente** 先手  
Corporation 株式会社

[www.sente.com](http://www.sente.com)

[david@sente.com](mailto:david@sente.com)

**sente** means competitive initiative  
in the game “Go”

Our focus is on productivity  
enhancements through **Faster:**

- **delivery of customer solutions**
- **delivery of information to users**
- **implementation of organizational changes**

## 1. Software Investment Insights

- Existing Requirements-Driven Development-Paradigm **Rarely Delivers** a Good Return on Investment (ROI)
- **The Challenge is to Deliver Solutions** vs. **Software**
  - **Software Pollution™**
  - **The Ever Increasing Development Backlog**
  - **Requirements Validation**
    - deploy order of magnitude better investments
  - **E-Type** vs. **S-Type** Software Systems

## 2. The *eccm* toolkit capabilities for Requirements Validation

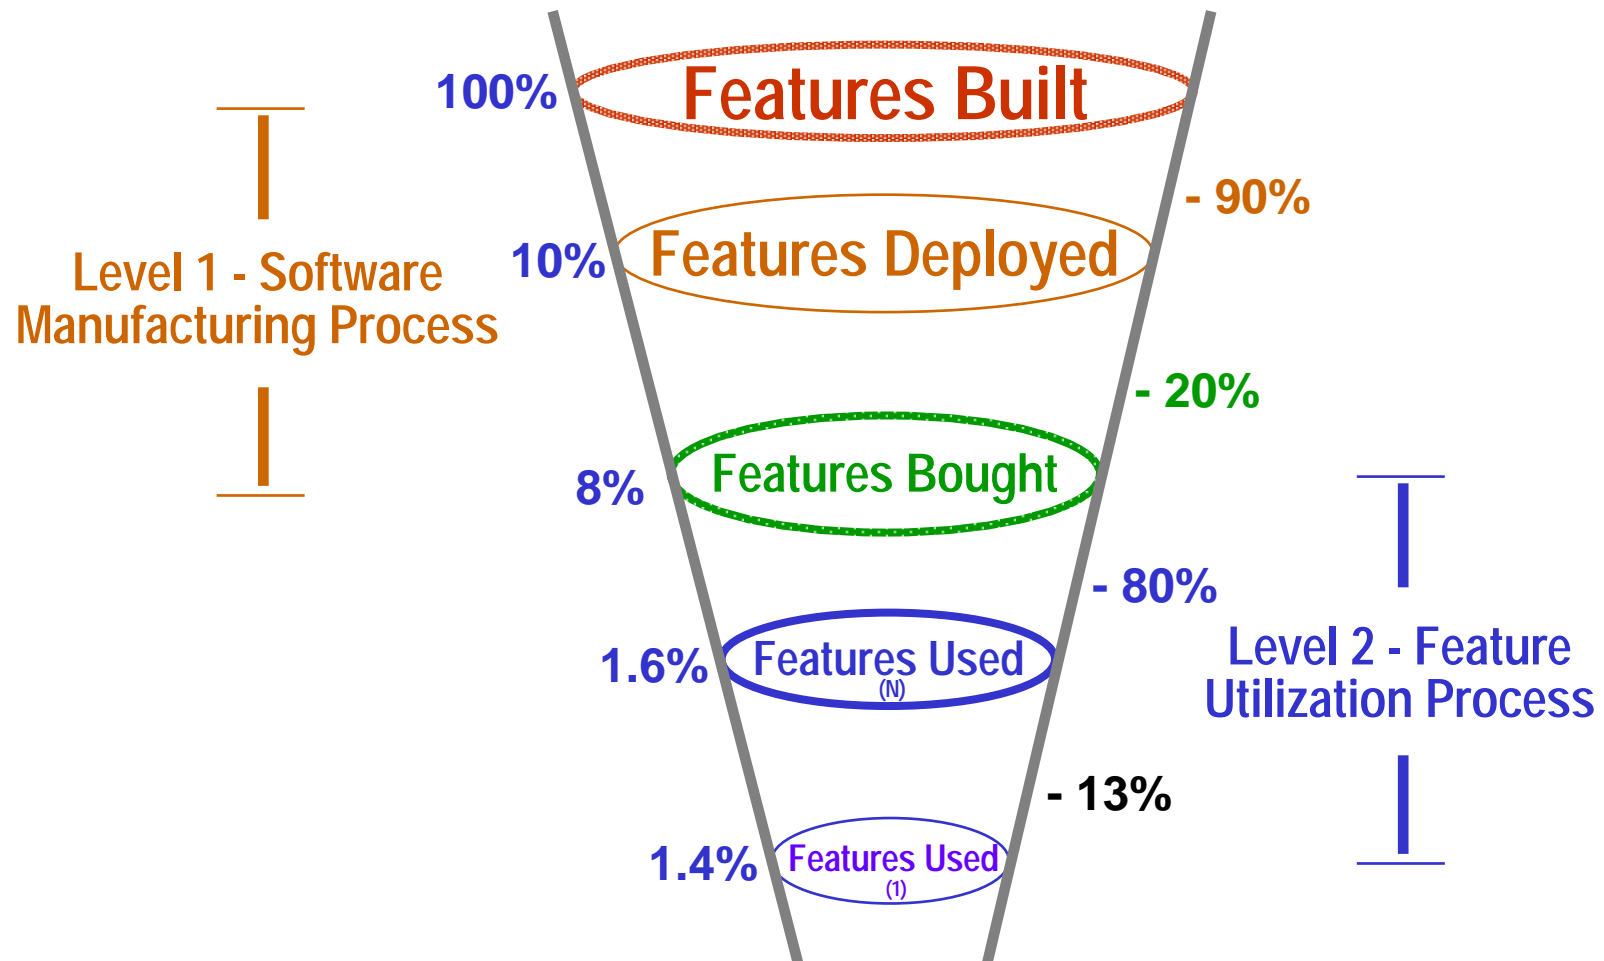

- **Architecture, User Interface, Business Rules**
- **Configuration Management, Operational Processes**
- **Center Productivity Management**

## 3. Summary

# Software Pollution™ (1/2)

## Feature Manufacturing and Utilization Analysis

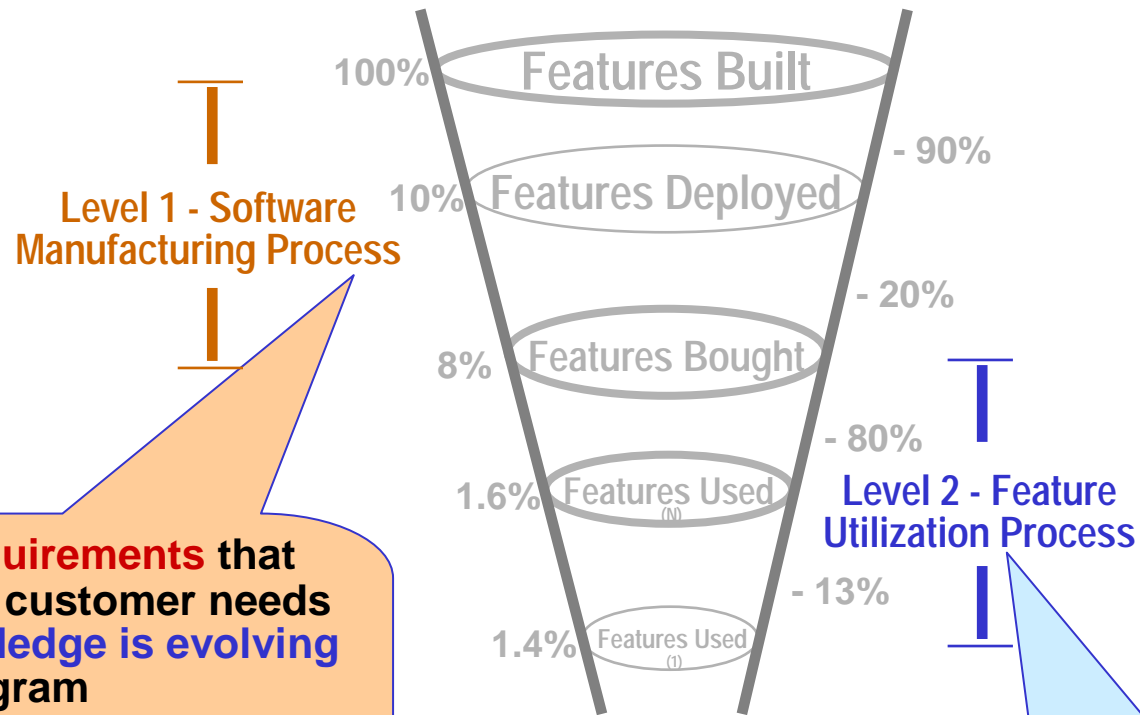

Ability to Remove Features  
Guide Re-engineering Programs

# Software Pollution™ (2/2)

## Feature Manufacturing and Utilization Analysis

- **Incomplete Requirements** that do not capture customer needs
- **Customer knowledge is evolving** during the program
- Development Team likes **long delivery programs**
- Development Team uses **“bleeding edge”** technology

- Users' ability to **absorb new features** is limited
- Features do not fit into **any** useful process
- Late delivered features **no longer relevant**

Requirements Pollution Levels – Mill spec.  
A Spec **100:1** B Spec **60:1** B1 Spec **25:1**

# Software Investment (1/5)

The Requirement Driven Paradigm Fails to Deliver ROI

Business Needs Transformed into Requirements

The Problem is Here

- Requirements Track Record:
- Incomplete, Inaccurate, Incorrect
  - Ad Hoc Validation, Reviews
  - 5-8% of Program Cost

Requirements By Release  
Existing Software Development Process

Meets Need

Continue Investment

ROI Good

We Try to Fix It Here

- More Releases (e.g., 6months; \$5M)
  - Architecture, User Interface, BRs, Processes, Reports, Flow-Through, and Training
  - Unstable Operations
- More Time and Investments
  - Never Meets Objectives 1<sup>st</sup> Time
  - Over 90% of Investment

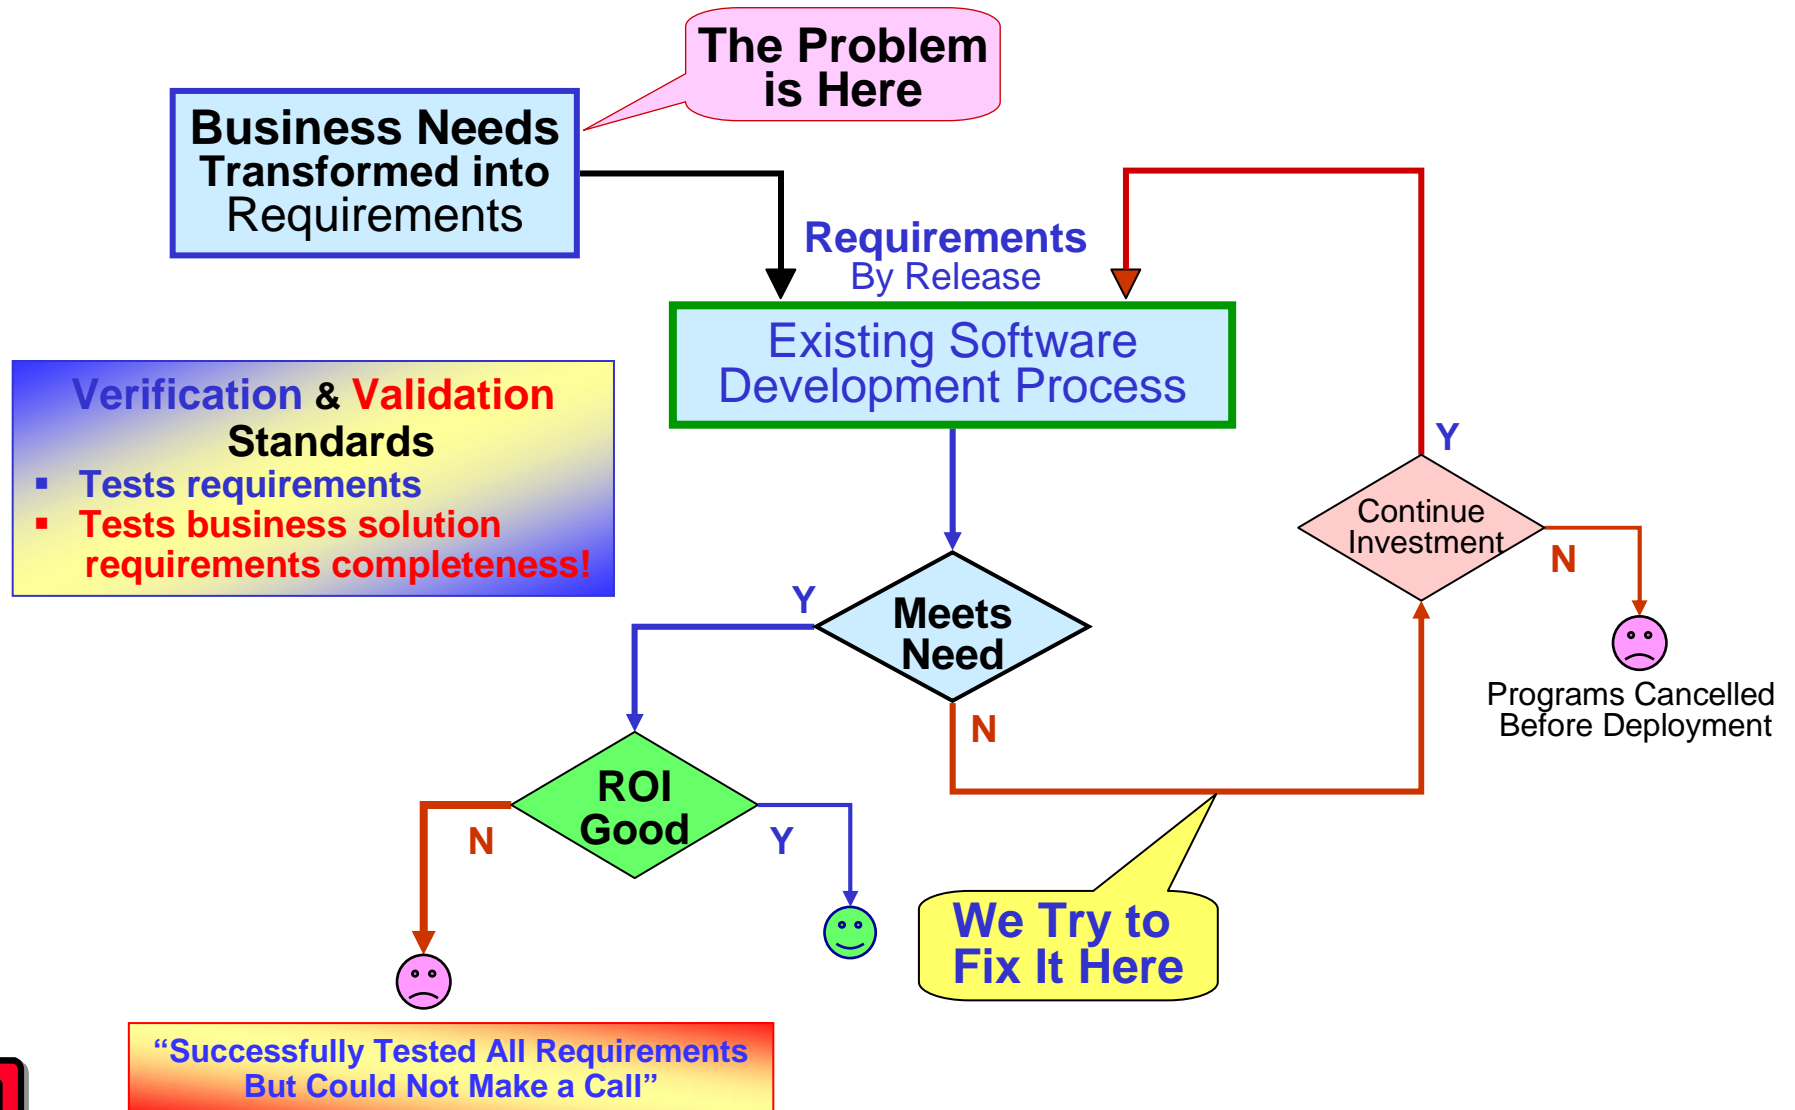

Programs Cancelled Before Deployment

Most Programs Fail to Deliver ROI Because Business Irrelevance  
It Takes Too Long to Get It Right

# Software Investment (2/5)

## Requirements Verification and Validation **Standards**

# The DEAL That Worked Well for Over Half a Century (Investment Paradigm)

- **The Business Invests in Software Solutions Based on **Incomplete and Inaccurate** Requirements**
  - the business unit produces the requirements; therefore, **it is its own fault** when the solution is unsatisfactory
  - the development team sticks to “feature coding assignments”
- **The Business Is Required to Continue Funding Enhancements to an Unsatisfactory Solution**
  - the solution is not able to keep up with the evolving business needs (new or newly learned); revenues/customers lost
  - the users are continuously living with incomplete (irrelevant) solutions; manual workarounds are the norm
- **The Development Team Is Rewarded With Ongoing Funding While It Delivers Barely Relevant Solutions**
  - **not accountable for ROI** and shows no interest expanding scope beyond “feature development”
  - System Integrators (SIs) are doing *barely better*
    - they cleverly shift accountability back to business unit
  - Recently acknowledged failures of supply chain management vendors

# Business Rule - Validation Results

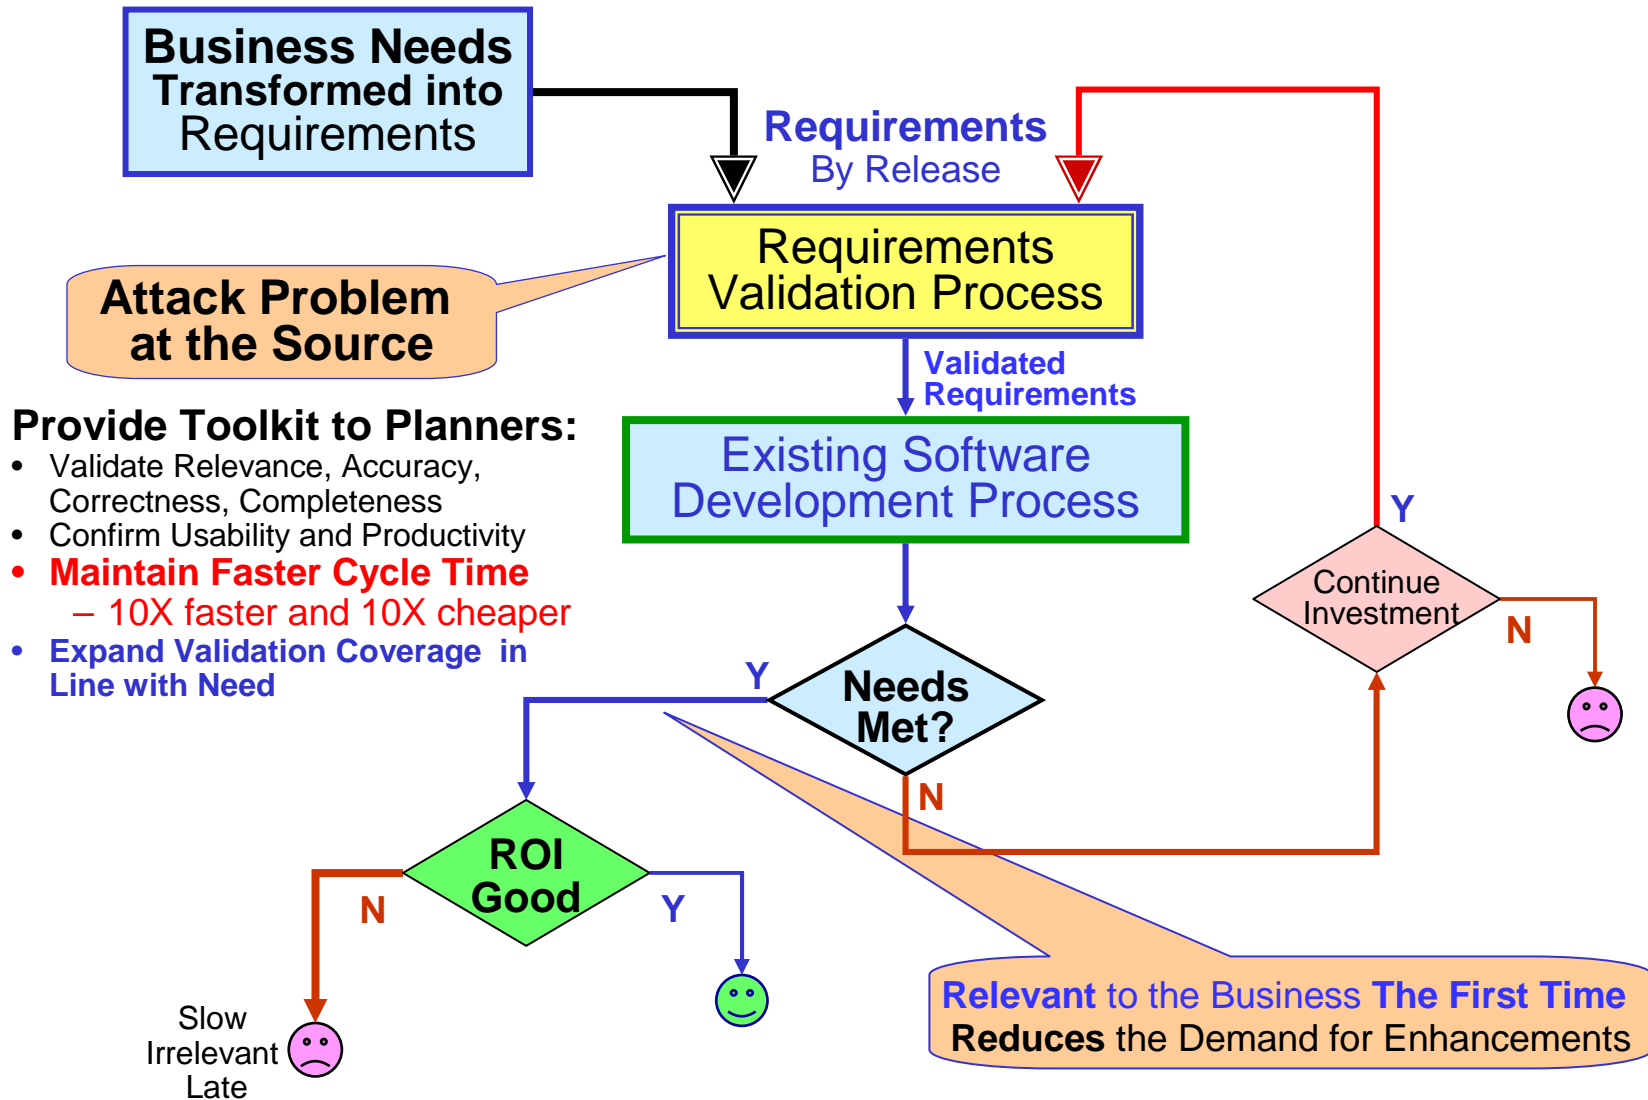

**The Business Rules Were Professionally Maintained**  
*Two Orders of Magnitude More Complex Than "Boolean Expressions"*

# Software Investment (3/5)

Improve Requirements Completeness through Validation

## Provide Toolkit to Planners:

- Validate Relevance, Accuracy, Correctness, Completeness
- Confirm Usability and Productivity
- **Maintain Faster Cycle Time**  
– 10X faster and 10X cheaper
- **Expand Validation Coverage in Line with Need**

## Definition of S-Type vs. E-Type Systems

*The Vendors' Economic Incentives Drive the Results* [Lehman 85]

- S-Type System** (M. Lehman, “Program Evolution: Processes of Software Change,” Acad. Press, 1985):
- **Specification based software** treats each release as reflected by the requirements; no capabilities are added to reflect life cycle expectations beyond software maintenance (e.g., operating system, DBMS, platforms)
  - **Software is always getting bigger, more complex with an incrementally reduced capability to fix bugs or adding features cost effectively**
    - There is a clear dependency between the demand for new features and increased software complexity (cause and effect)
    - The ROI is getting incrementally worse – we never hit the wall because the business unit is forced to reduce feature-demand by relevance and cost considerations
    - The IT Organization has only **ONE alternative**, that is to **start a new replicated development program** to fight the “software development bottleneck” (*developers rarely able to reuse previous platforms because of code ownership, obsolescence and reuse considerations*)
    - Software pollution becomes an ROI measure (increased pollution reduces solution’s life cycle)

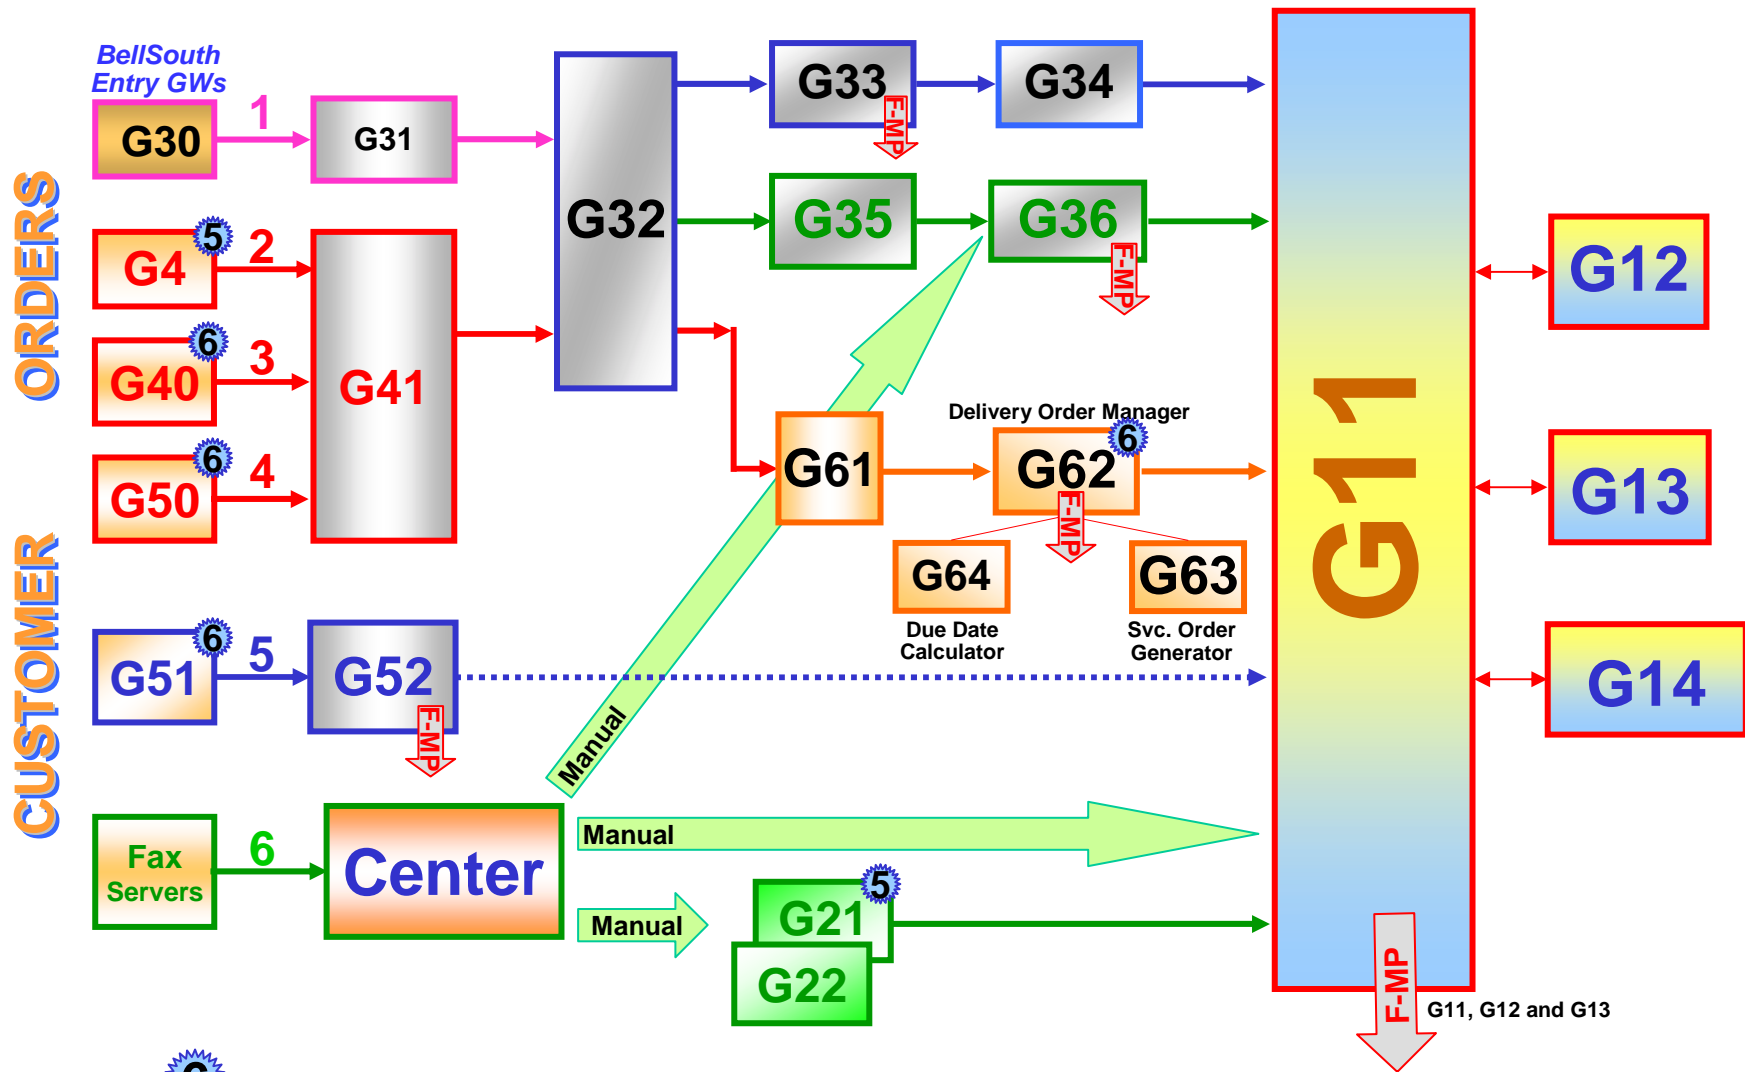

## E-Type System:

- **Evolution based software** is designed to handle tasks and to evolve with *expected* changing needs through configuration management (CM) capabilities
  - **Requirements are viewed as representative of possible needs** into the future
  - Success criteria includes **the ability to expand capabilities without software development** (e.g., new business rules, process changes, report changes)
  - Software complexity of E-Type systems is increasing at a **slower rate**
  - **Software complexity is proactively reduced** through
    - reimplementation of functionality with increased e-capabilities
    - removal of features that are no longer needed/used but add complexity and maintenance cost
- A **validation platform** can be used to validate requirements reducing the software churning in search of the “true” business-need definition (requirements)

# System Architecture Evolution

The Objective: Effective Order Processing – Real Flow Through  
 (RFLT Definition: Electronic Processing of a Customer Order Delivered to G11)

**6**  
 FE Data Validation  
 (S1, S2, S3, S4, G11, G12)

**Software Bottleneck Solutions**

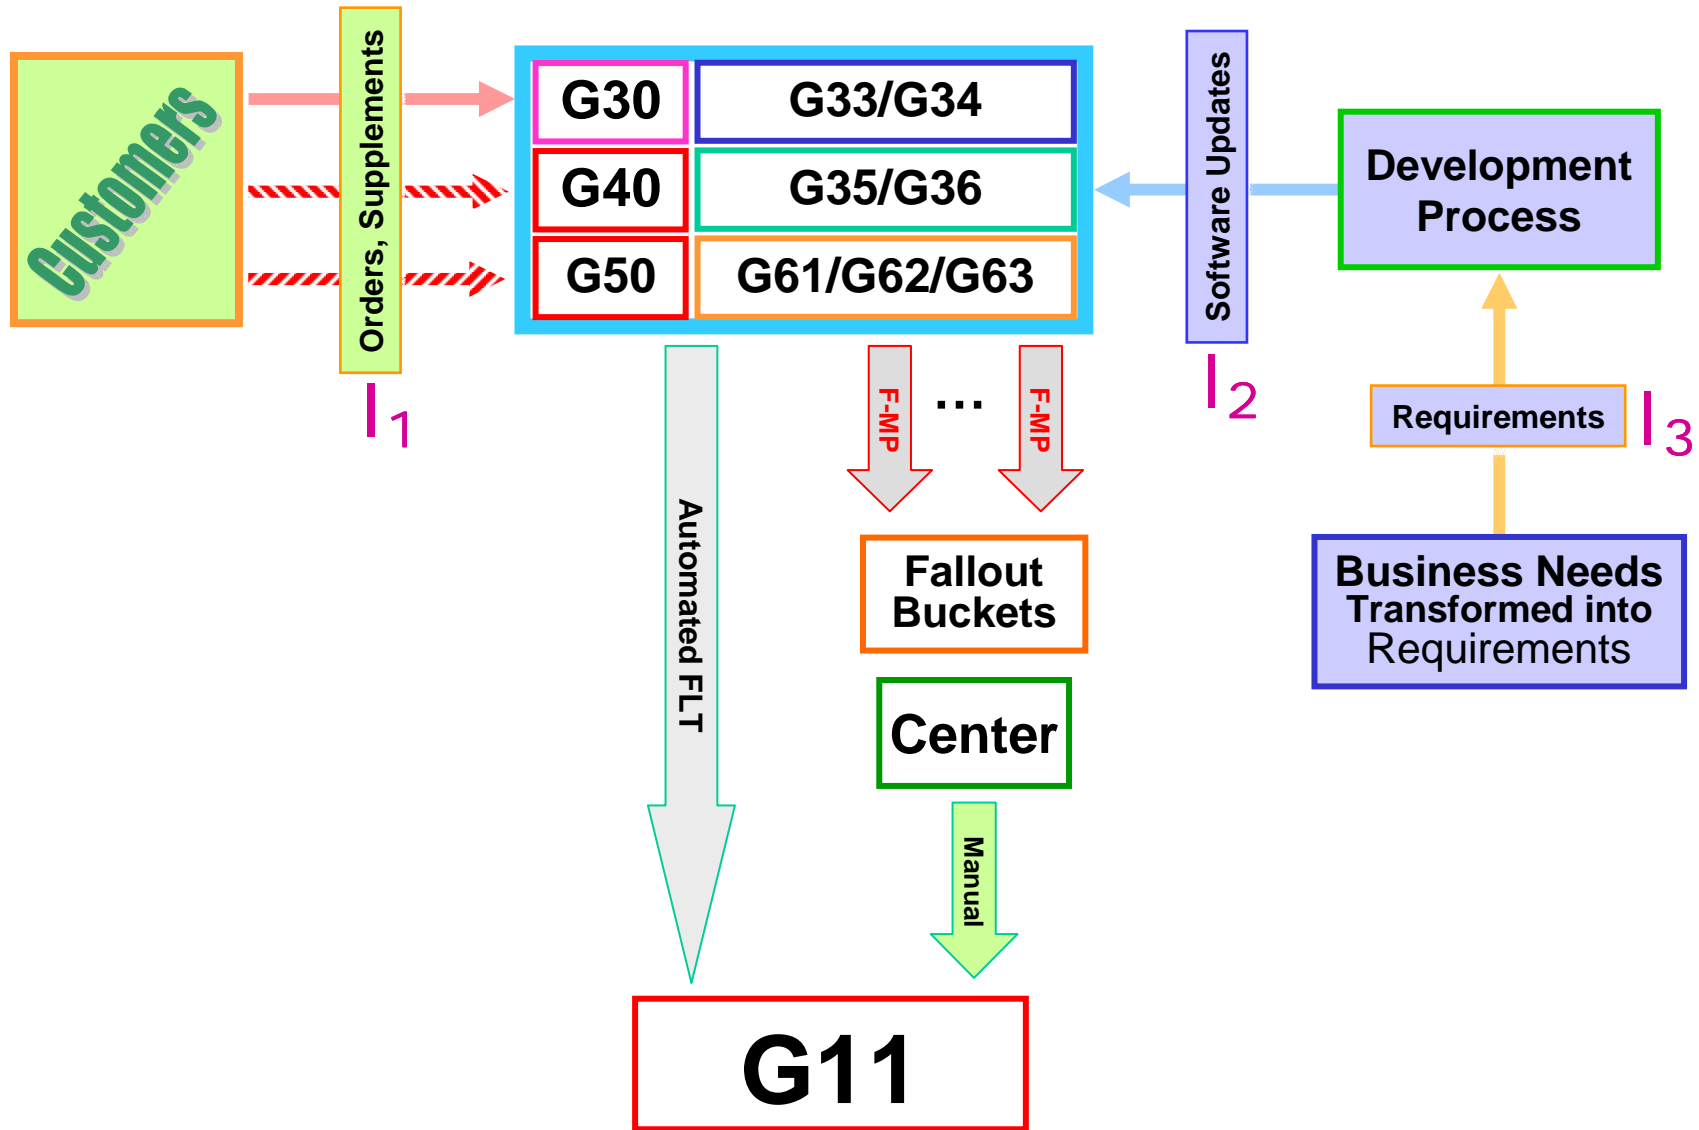

- Concurrent Development Teams
- Replicated System Functionality
  - Developers are possessive of their code
  - The churning in functionality is killing the software

**F-MP** Fallout - Manual Processing

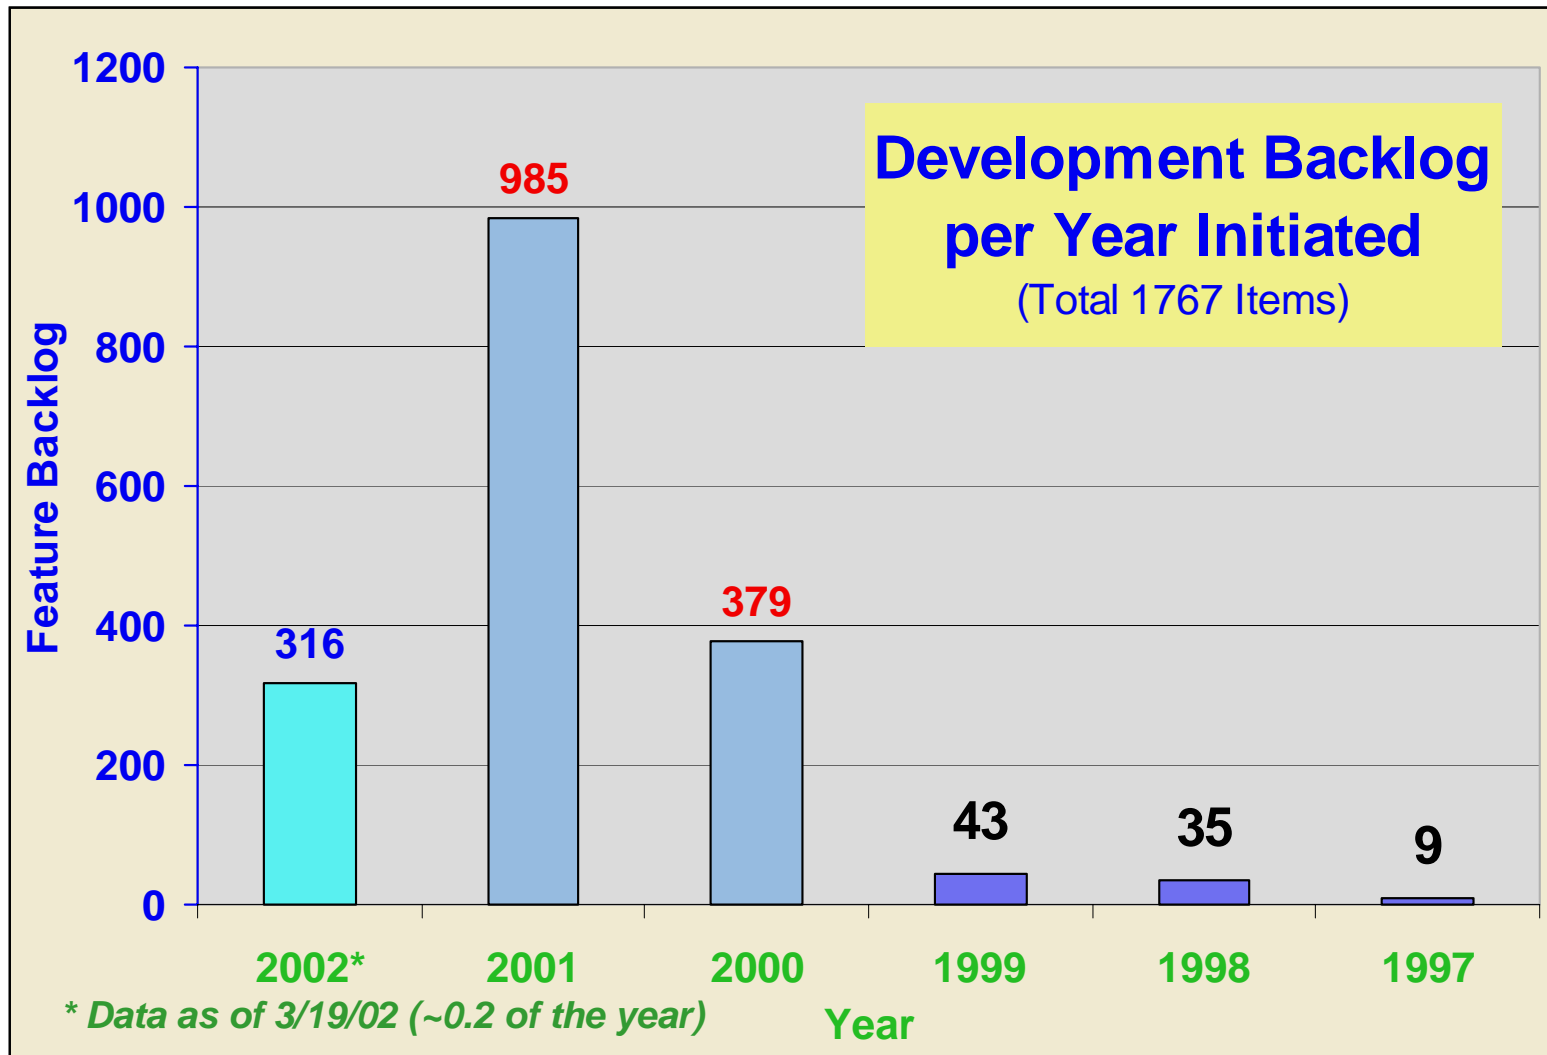

# Software Investment Model (4/5)

Automatic Flow Through Processing

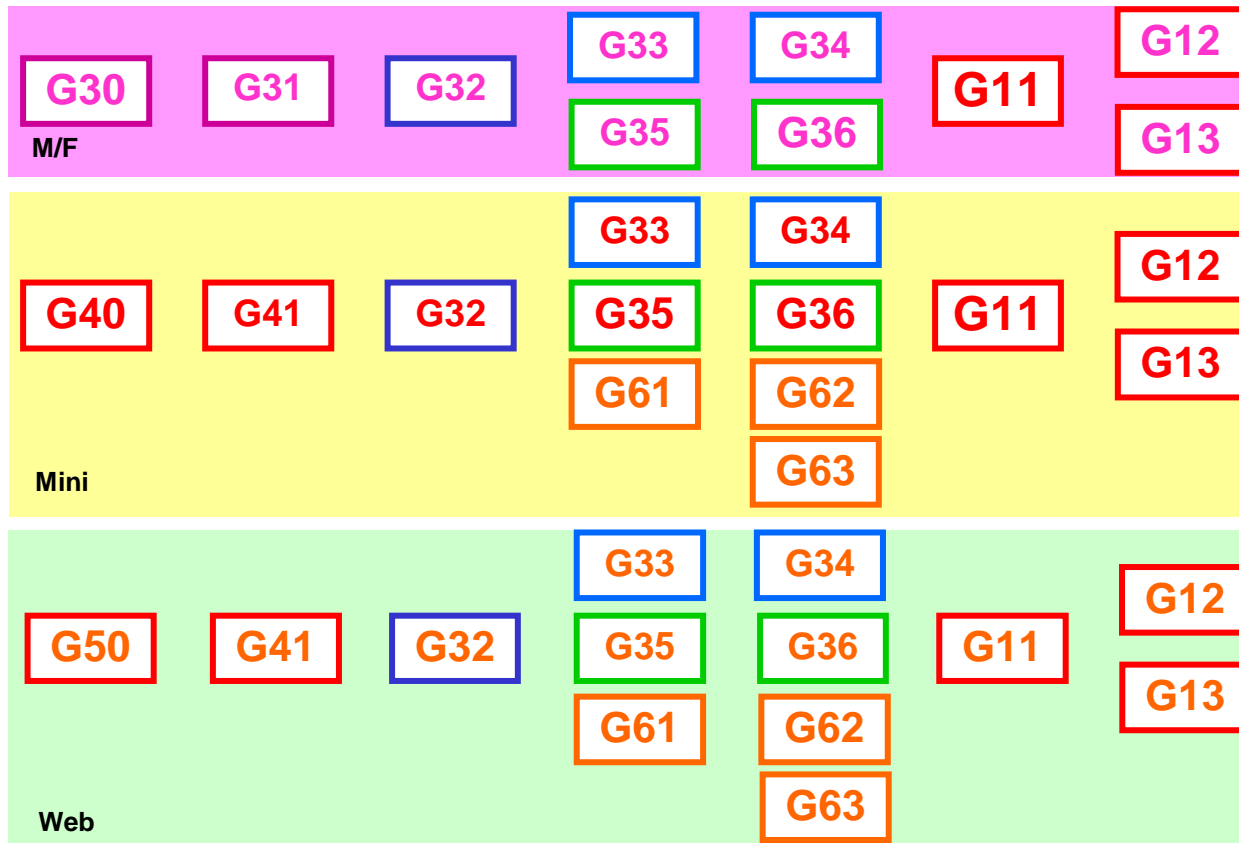

# Feature Development Backlog per Year

## Historical Summary (e.g., 9 features still open since 1997)

# Evolution of a Legacy Solution

## A Solution's Life Cycle

1. New needs cannot be satisfied by existing solutions because of a **large feature backlog**, limited development-team throughput and high cost
2. A new solution is approved that **is promised to be faster and cheaper** (there is no alternative) 
3. The **new solution is late** to meet initial commitments
4. A **feature backlog develops** for the new solution 

**Software Bottlenecks Are Generic and Predictable**

- **Responsible for provisioning data circuits for the wireless industry**
  - connectivity between switches, antennas, etc.
- **Over 500 customers (revenue \$2B/year)**
  - 50 Reps, 40 System Designers
- **Over 80,000 orders per year**
  - orders are received in the center through faxes and emails
  - it takes an average **~1.5 hours** to process an order per Rep *including related clarifies and escalations*
  - each new order must be processed within 12-24 hours
- **Center staffing growing ~30% per year in line with customer orders**
  - recruiting is major challenge
    - it takes **~6 months** to get a new Rep trained/productive
- **Success Criteria: Improve Rep Productivity to Eliminate Staff Growth**

# Software Investment (5/5)

Supports Validation of Capabilities in Six Key Areas

**Architecture  
Configuration Management**

**Web Based UI**

*electronic customer  
contact management*

***eccm Toolkit***  
Release V.28

**Business Rules**

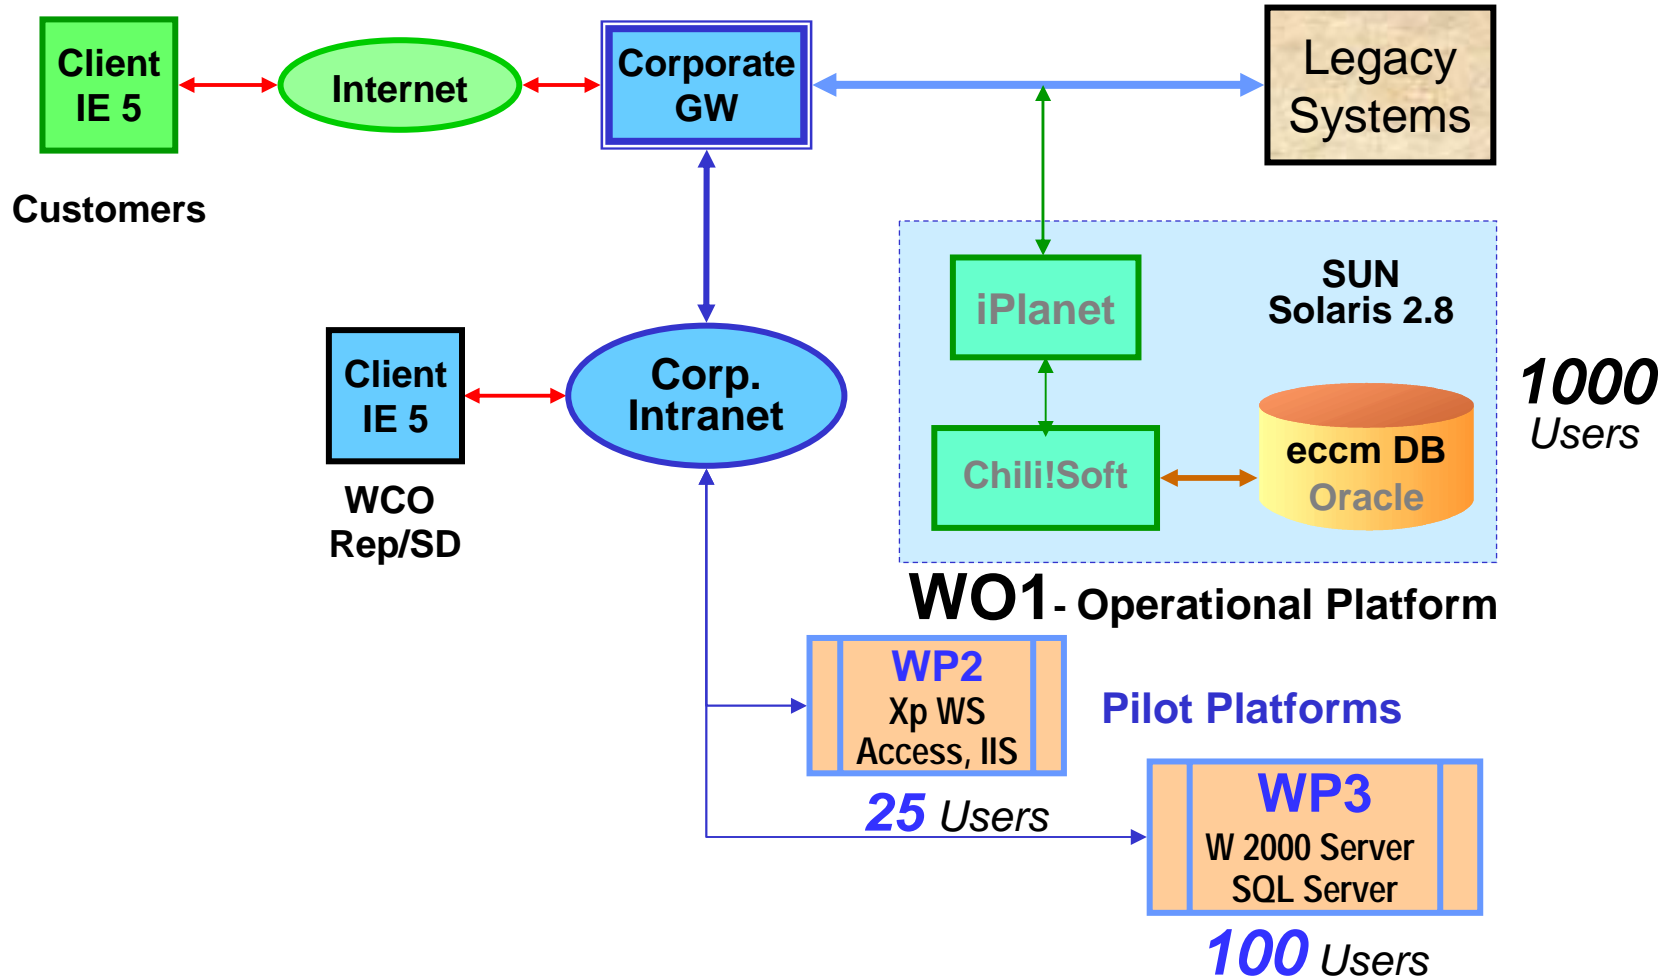

**Operational Processes  
Center Productivity Management**

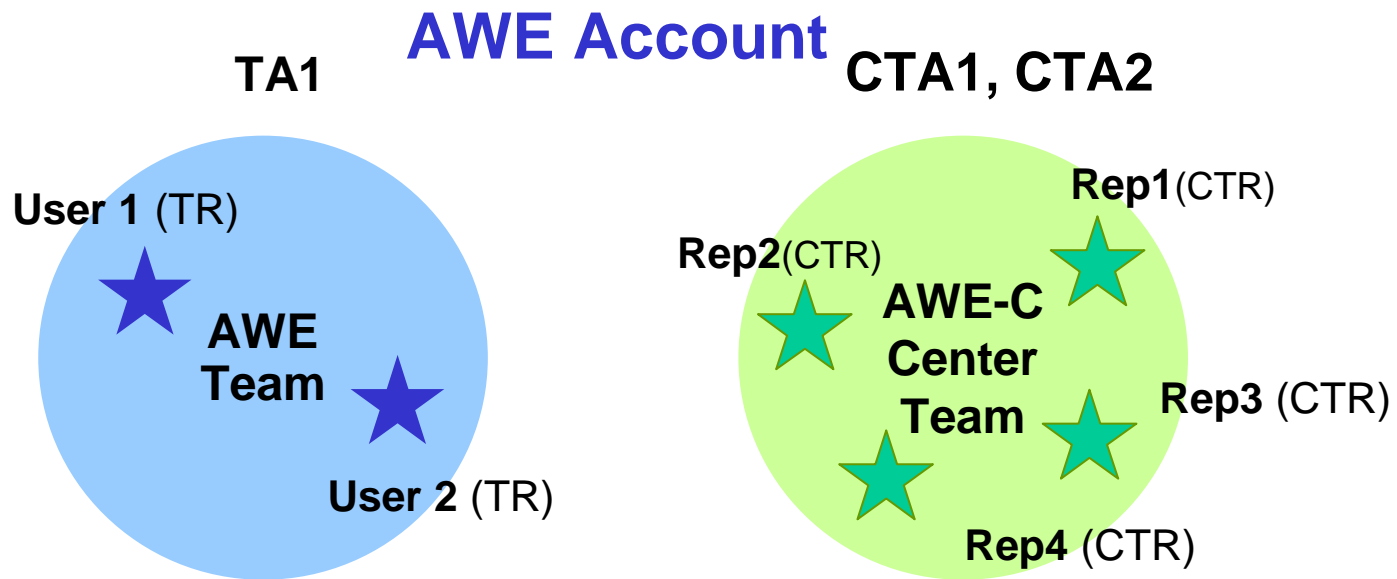

- 10 Times Faster  
Cycle Time (Robust)
- Validation Coverage  
Expanded with Need

# Deployment Strategy and Architecture

## Managing Change Management

**SA** - SA1, SA2, SA3

**TA** - team administrator

**TR** - team Rep

**CTA** - center team administrator

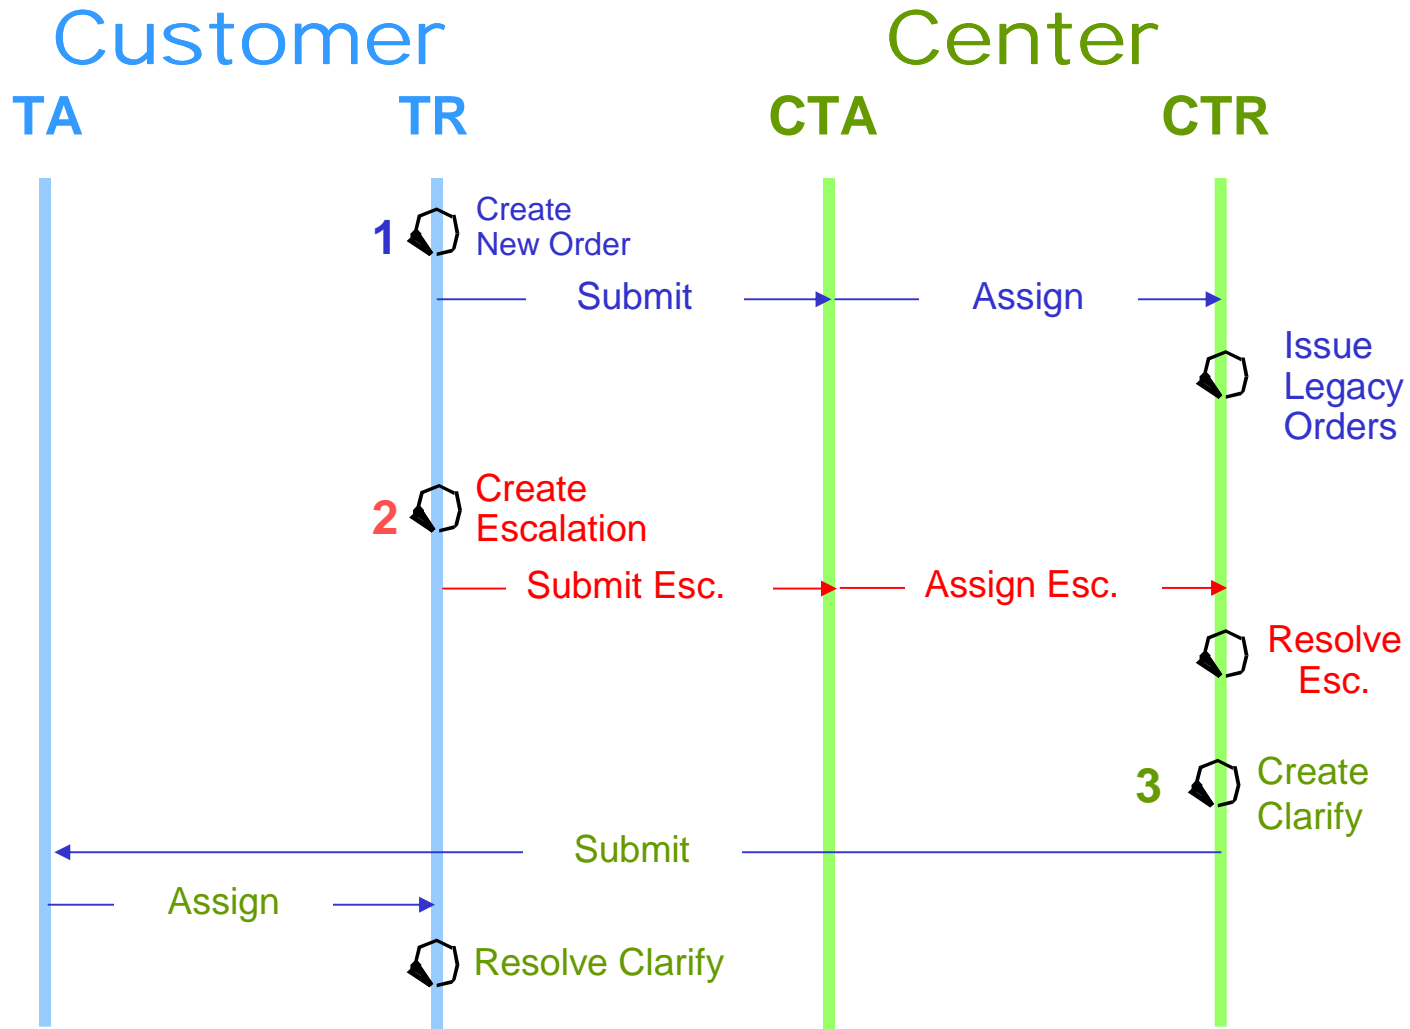

**CTR** - center team Rep

**SA** - system administrator

# Operational Processes Validation

Create New Order, **Escalation** and **Clarify** Processing

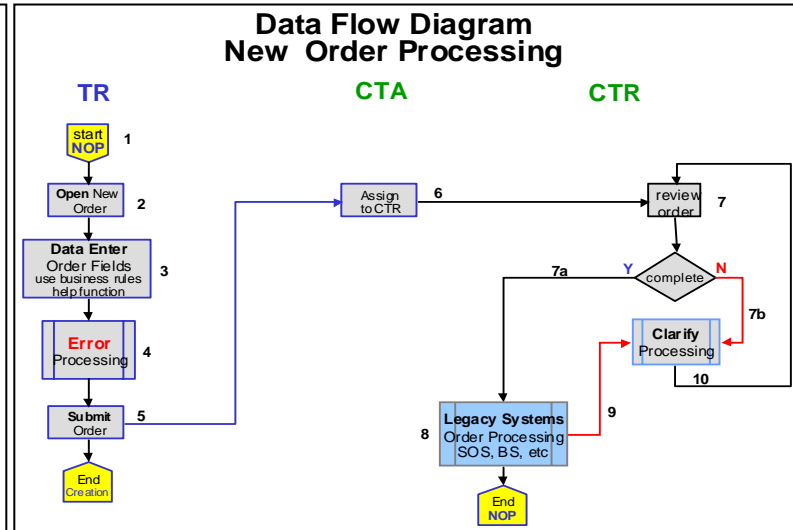

# Process Definitions in (1+4)D

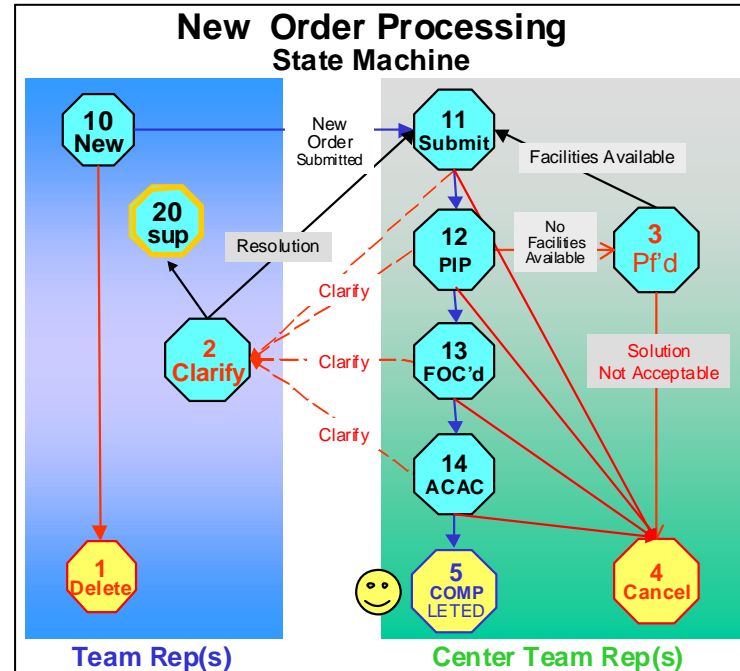

**Description**  
**New Order Processing**

1. Initial Conditions: The Customer Wants to Purchase a Link (e.g., Prem to Prem) to Meet their Wireless Network Needs.  
 A TR is assigned by the TA to Create a New Order in Line with the business needs.
2. The TR Logs-in to the **eccm** application:
  - selects **Prem to Prem MEGALINK/Light/Plus**
  - selects **Create New Order**
3. The TR Data Enters the details of the new order - one field at a time
  - periodically the TR saves the content of the order
  - periodically the TR may verify completeness of the order
    - error messages will be presented in a separate window
    - errors can be fixed incrementally or once the data entry was completed
  - if necessary the session can be terminated and the data entry operation can be renewed at a later time
4. The TR makes all the error corrections
  - clicking on each error message will position the cursor at the right field for correction
  - required and conditionally required business rules are enforced
  - data integrity business rules (telephone number, date, email) are enforced
  - any attempt to submit an incomplete order results in automatic verification with all defects presented in the error window
5. The TR Submits the verified (completed) order to the CTA
  - the order status is changed from New to Submitted
  - the TR no longer can make changes to the order unless a Sup Order is created
6. The CTA Assigns the New Order to appropriate CTR
7. The CTR Reviews Order for completeness
  - If the order is not complete issues a Clarify to the TR
8. Initiate Legacy System Processing

**Screen Layouts**  
**New Order Processing (1/23)**

# Summary Results

- **Eliminated software bottlenecks** in the delivery of business solutions, *shifting the challenge from software development to change management*. Software releases are developed weekly and deployed monthly because of our limited ability to distribute changes effectively to over 1000 physically distributed users.
- **Improved delivery of relevant and complete solutions to center users** (in comparison to similar past projects):
  - **Software release cycle-times** increased by a factor of *fifteen* facilitating effective deployment of newly acquired operations-insight (e.g., weekly/daily releases).
  - **Software release cost** has been reduced by at least *two orders of magnitude* with a less than *18 month* ROI.
  - **Software release quality** has improved by a factor of *fifty* using field reported Severity 1 and 2 defects.
  - **Software release training interval** was reduced by *at least two orders of magnitude* (e.g., to 4-8 hours)
- **Enhanced center productivity at both the individual and team levels using throughput, cycle time and quality measurements:**
  - **Average Rep productivity** has increased by *a factor of four*.
  - **Variance in Rep performance** within the same team was reduced by *a factor of ten*.
  - **Create-Submit interval** for new customer orders was reduced by *a factor of fifty*.
- **Reduced significantly development feature churning** caused by incomplete requirements. In the past, without the validation process, development used business rules that were correct only one in seven (e.g., Megalink order).
- **Validated real time and report based measurements** to professionally manage center resources and to improve the team's process-maturity level.
- **Utilized change-management capabilities** that *preserve the center's productivity during release deployments*.

# Summary – Requirements Validation

Improves Solution's Quality, Life Cycle and ROI

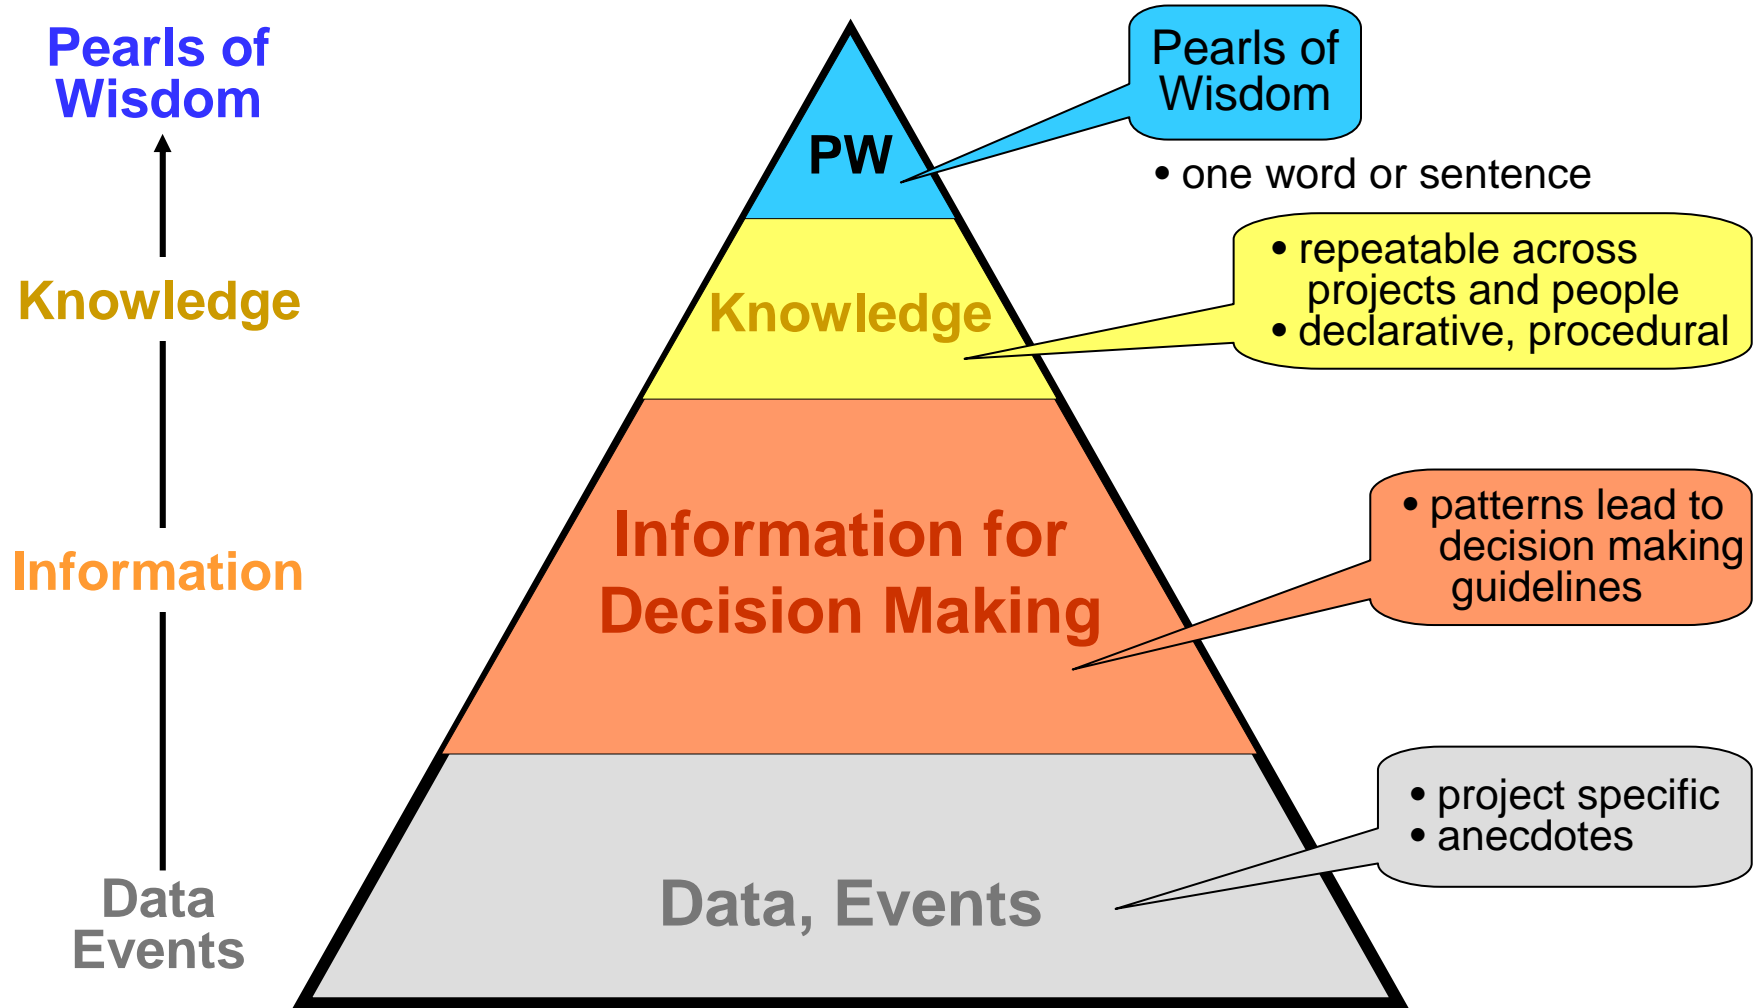

# Backup Slides

# Insight Categories by Knowledge Density

# Pearls of Wisdom

## Summary

---

- Do it **Predictably, Incrementally, and Faster**
  - Must Have Success Criteria - Get an “A”
    - Invest Incrementally in Line with Demand (#customers, users)
    - Operate in 3D (service, distribution channel, operations features)
  - Increase Influence of the Individual
  - Validate Requirements
- Do **Less**
  - Do not confuse motion with progress
- Do **Less with Software**
  - Give a Child a Hammer and “*everything will look like a nail*” - give an IT organization an opportunity to contribute and “the solution will require software development”; everybody shifts solutions into their domain of expertise.
  - *There are always **effective** alternatives*
    - *Think e-capabilities*
- All Re-engineering and Large Complex Projects are “**sold on fear**” and will **FAIL to Deliver ROI** (limited/no ROI on the investment)
- **Each Release that is Y months long will be late by X months**  
(e.g., Y=12, X=6; (Y=6, X=2) (Y=3, X=0.5))
